

**Description:**

We use Data Analytics in everyday life without even knowing it.  
For eg : Going to a market to purchase car

**Plan**

I first decide my budget than which things I need before going to purchase.  
Its new car or old car.

**Prepare**

Next I need to check how much I am willing to spend and how to get that money.

**Process**

Then I need to check how much I want from the data. Like if I am going to buy new car what do I want – Tata motors /Volvo /Honda/ Kia/ Hyundai Motors etc.

**Analyse**

i obviously won't buy car which are old year manufacture, Also you need to check does the car have all future like company Name, manufacture Year, Mileage,feul type, Engine, Seats, Model, Power, Price etc.  
That I want and, will it is in my budget. Also take a test drive.

**Share**

Now i communicate my idea to the dealer to find the best suitable fit for me.

**Act**

Then i finally buy it!
